

- 28 Light of wavelength λ is incident normally on two narrow slits S_1 and S_2 , a small distance apart. Bright and dark fringes are observed on a screen a long distance away from the slits.

The n th **dark** fringe from the central bright fringe is observed at point P on the screen.

Which equation is correct for all positive values of n ?

- A $S_2P - S_1P = \frac{n\lambda}{2}$
 - B $S_2P - S_1P = n\lambda$
 - C $S_2P - S_1P = (n - \frac{1}{2})\lambda$
 - D $S_2P - S_1P = (n + \frac{1}{2})\lambda$
- 29 Green light is incident normally on a diffraction grating and forms a diffraction pattern on a distant screen.

Which change, on its own, would **decrease** the separation of the diffraction maxima on the screen?

- A Increase the distance between the screen and the diffraction grating.
- B Replace the diffraction grating with a grating that has a smaller separation between the slits.
- C Replace the diffraction grating with a grating that has fewer slits per unit length.
- D Replace the green light with red light.
