

- 1 A student estimates the maximum speed of some different moving objects.

Which maximum speed is **not** a reasonable estimate?

- A container ship: 10 m s^{-1}
- B Olympic sprinter: 0.1 km s^{-1}
- C racing car: 9000 cm s^{-1}
- D snail: 0.01 km h^{-1}

- 2 Which quantity is an SI base quantity?

- A force
- B newton
- C second
- D time

- 3 A student takes measurements to determine the constant acceleration of a model car moving from rest in a straight line. The measured values with their absolute uncertainties are shown.

quantity	measured value	uncertainty
displacement	16.5 m	$\pm 0.1 \text{ m}$
time	15.0 s	$\pm 1.0 \text{ s}$

The student uses the equation $s = \frac{1}{2}at^2$ to calculate the acceleration of the car.

What is the acceleration and its absolute uncertainty?

- A $(0.11 \pm 0.01) \text{ m s}^{-2}$
- B $(0.11 \pm 0.02) \text{ m s}^{-2}$
- C $(0.15 \pm 0.01) \text{ m s}^{-2}$
- D $(0.15 \pm 0.02) \text{ m s}^{-2}$
