19 Pollen grains are suspended in a liquid and are illuminated strongly. When observed under a microscope they are seen to be in continuous random motion.

What is the reason for this?

- A convection currents in the liquid
- B evaporation of the liquid
- **C** molecules of the liquid colliding with the pollen grains
- **D** pollen grains colliding with each other
- **20** A number of similar springs, each having the same spring constant, are joined in three arrangements X, Y and Z. The same load is applied to each.

What is the order of increasing extension for these arrangements?

	smallest		largest
Α	X	Υ	Z
В	Z	X	Υ
С	Z	Y	X
D	Y	Х	Z
