| A curve has equation $y = x^2 + 2cx + 4$ and a straight line has equation $y = 4x + c$ , where c is a constant. | tant. |
|---|-------|
| Find the set of values of $c$ for which the curve and line intersect at two distinct points.                    | [5]   |
