18 Brownian motion can be demonstrated by illuminating smoke particles inside a closed, transparent container. When the particles are viewed using a microscope, bright specks of light are observed to move with constant, random motion.

What **cannot** be inferred from this observation?

- A Air molecules are in constant motion.
- **B** Air molecules are in random motion.
- **C** Air pressure is due to air molecules colliding with the container.
- **D** The mass of an air molecule is much less than the mass of a smoke particle.
- **19** A U-tube has one arm of area of cross-section A and the other of cross-section 4A. The tube contains water of density $1000 \, \text{kg m}^{-3}$ and oil of density $850 \, \text{kg m}^{-3}$, as shown.

The column of oil on top of the water in the left-hand arm is of length 30.0 cm.

What is the difference in height *x* between the levels in the two arms of the tube?

- **A** 4.5 cm
- **B** 6.2 cm
- **C** 23.8 cm
- **D** 25.5 cm
