2 A steel ball is projected horizontally from the top of a table, as shown in Fig. 2.1.

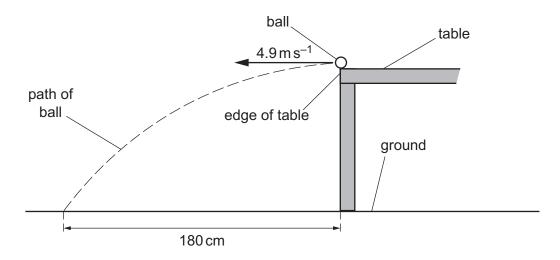

Fig. 2.1 (not to scale)

The ball is projected horizontally at a speed of $4.9\,\mathrm{m\,s^{-1}}$. The ball lands on the ground a horizontal distance of 180 cm from the edge of the table.

Assume that air resistance is negligible.

(a) (i) Calculate the time taken for the ball to reach the ground.

(ii) Calculate the vertical component of the velocity of the ball as it hits the ground.

velocity =
$$m s^{-1}$$
 [2]

(iii) Determine the magnitude and the angle to the horizontal of the velocity of the ball as it hits the ground.

(b) The ball is projected by means of a compressed spring which is attached to a fixed block as shown in Fig. 2.2.

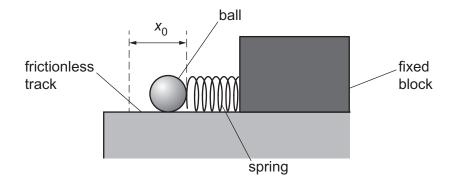

Fig. 2.2

The ball is placed on a frictionless track in front of the spring. The ball is then pulled back so that the spring has compression x_0 .

When the spring is released, the ball is projected horizontally as shown in Fig. 2.3.

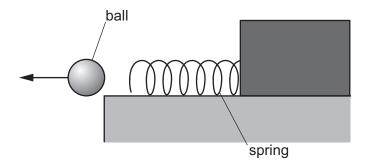

Fig. 2.3

The variation with compression *x* of the applied force *F* for the spring is shown in Fig. 2.4.

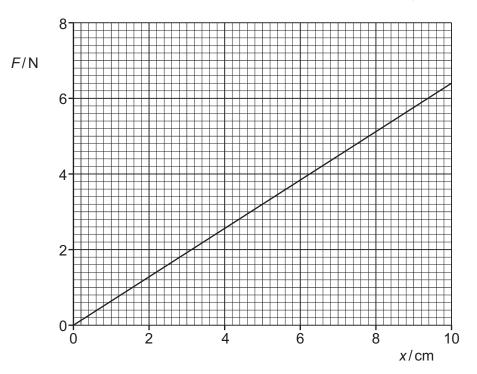

Fig. 2.4

The ball is a uniform sphere of steel of diameter 0.016 m and mass 0.017 kg.

(i) Calculate the density of the steel.

density =
$$kg m^{-3}$$
 [3]

(ii) All of the elastic potential energy in the spring is converted into kinetic energy of the ball. The speed of the ball as it leaves the spring is 4.9 m s⁻¹.

Show that the maximum elastic potential energy of the spring is 0.20 J.

	(iv)	k=
(c)	The	x_0 =
	The spring is given compression x_0 and is then released. Air resistance on this ball is not negligible after it leaves the spring.	
	Exp	lain: why this ball leaves the spring with a greater speed than that of the steel ball
	(1)	
	(ii)	why this ball takes a longer time to reach the ground than the steel ball.
